

Longitudinal organization of HI molecular modules

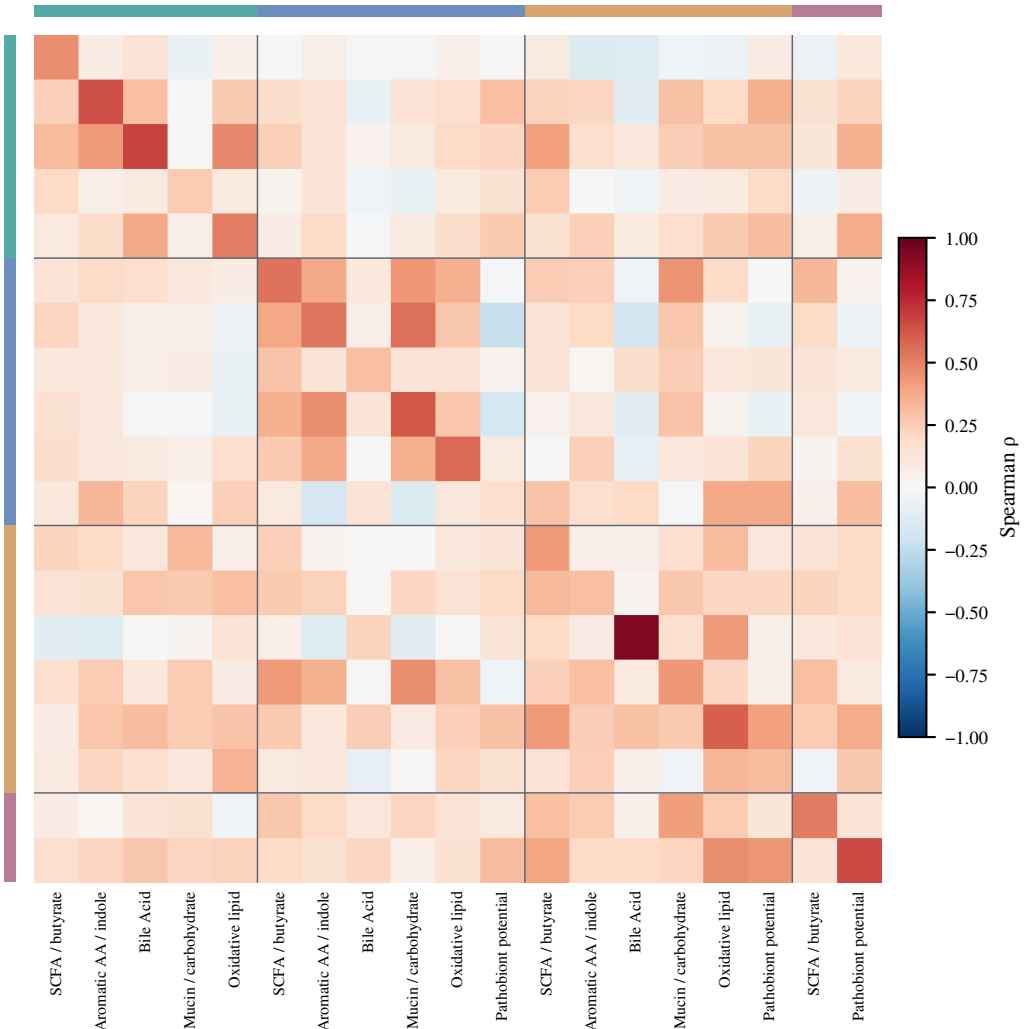

92 complete t2–t3 windows · 53 participants · 19 MBX/MGX modules · observed 2–30-week intervals

MBX MGX EC MGX pathway MGX taxonomy

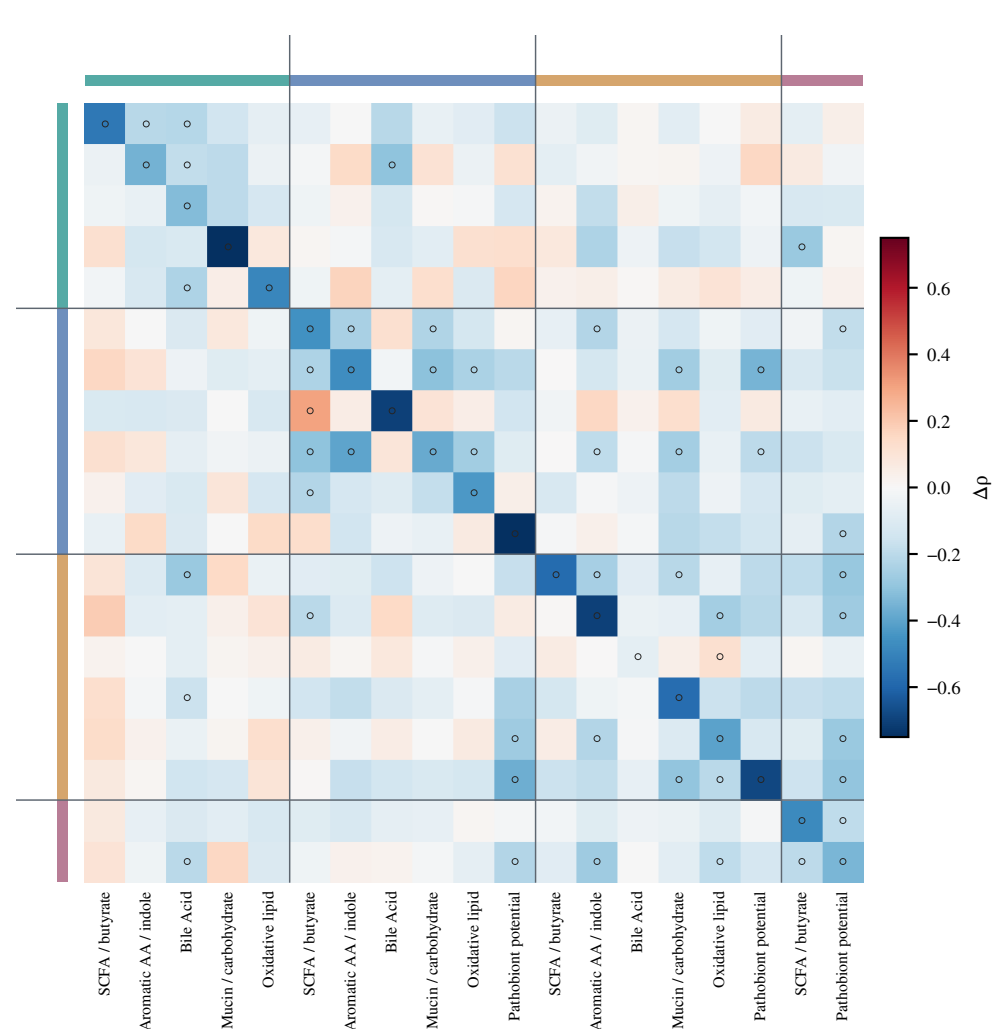

A Same-visit association (t2 × t2)

B Next-visit association (t2 × t3)

C Change in association (B – A)

Open circles in C: participant-bootstrap 95% interval for $\Delta\rho$ excludes zero (500 resamples). Descriptive stability, not FDR significance.

All matrices use identical complete windows. Diagonal in A equals 1 by definition; C reflects both cross-visit persistence and current-visit correlation.

D Persistence of each module across visits
